Introduction

Statistical identification of critical, dependent and redundant articulators

Veena D Singampalli and Philip JB Jackson

Outline

Introduction

Interarticulatory correlations

Algorithm for identification of articulatory roles

Evaluation by exhaustive search and trajectory generation

Summary

Articulatory representations in modelling coarticulation and in ASR:

- distinctive phonetic features [Henke, 1965, Daniloff and Hammarberg, 1973, Eide, 2001, Kirchhoff, 1999]
- gestural constraints based on articulatory phonetic rules [Recasens et al., 1997, Erler and Freeman, 1996, Richardson et al., 2000]

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

• statistical descriptions [Blackburn and Young, 2000, Bakis, 1991].

Constraints on gestures determined by role:

- Critical
- Dependent
- Redundant

Veena D Singampalli and Philip JB Jackson

- Outline
- Introduction
- Interarticulatory correlations
- Algorithm for identification of articulatory roles
- Evaluation by exhaustive search and trajectory generation

Summary

Midsaggital views of human speech production system:

• EMA data from MOCHA database [Wrench, 2001] for one male and one female speakers, Hann window smoothed, 10ms frame rate.

¹[Saltzman and Munhall, 1989]

Our approach

Statistical identification of critical, dependent and redundant articulators

Veena D Singampalli and Philip JB Jackson

Outline

Introduction

Interarticulatory correlations

Algorithm for identification of articulatory roles

Evaluation by exhaustive search and trajectory generation

Summary

Our algorithm

- is entirely statistical and data driven
- identifies articulatory roles (1D and 2D versions)
- captures the constraints in terms of:
 - correlated movement of every articulator in space

イロト 不得 トイヨト イヨト

-

2 correlations amongst articulators

Generation of Trajectories

Statistical identification of critical, dependent and redundant articulators

Veena D Singampalli and Philip JB Jackson

Outline

Introduction

Interarticulatory correlations

Algorithm for identification of articulatory roles

Evaluation by exhaustive search and trajectory generation

Summary

Linear interpolation between

- static target positions of all articulators.
- successive target positions of critical and dependent articulators; no target positions were specified for redundant articulators.

• Evaluation of errors: Normalised RMSE and correlation between filtered synthetic and original trajectories.

Results

Statistical identification of critical, dependent and redundant articulators

Veena D Singampalli and Philip JB Jackson

Outline

Introduction

Interarticulatory correlations

Algorithm for identification of articulatory roles

Evaluation by exhaustive search and trajectory generation

Summary

Evaluation of errors

• Improvement obtained using our model over static targets:

Method	Male	Female
Norm. RMSE	2.3%	2.3%
Correlation	2.7%	3.2%

Summary

Statistical identification of critical, dependent and redundant articulators

Veena D Singampalli and Philip JB Jackson

Outline

Introduction

Interarticulatory correlations

Algorithm for identification of articulatory roles

Evaluation by exhaustive search and trajectory generation

Summary

Conclusions:

- Proposed a compact, data driven algorithm that
 - captures the statistical dependencies
 - identifies the changing articulatory roles
- Preliminary evaluation of the model showed improvement

Future work: Using the knowledge of articulatory roles to

- better model the constraints on articulatory movements
- integrate into our trajectory based recognizer.
